

# THE THREAT OF OIL & GAS POLLUTION

## Oregon

Methane, the primary component of gas, is an invisible, odorless greenhouse gas that is a powerful driver of climate change — 87 times as powerful as carbon dioxide during the time it remains in the atmosphere.<sup>1</sup> The oil and gas sector is the largest source of methane in the U.S., leaking or intentionally venting large quantities of this dangerous pollutant into our air every day. In 2014, the oil and gas industry emitted over 9.8 million metric tons of methane, a number 34% higher than previous estimates.<sup>2</sup> The near-term climate impact of these emissions is equal to the pollution caused by more than 200 coal-fired power plants over 20 years.

Along with methane, oil and gas facilities often release other air pollutants that can harm our health, including formaldehyde, benzene, acetaldehyde, and ethyl benzene. These toxins can cause cancer, respiratory symptoms, anemia, brain damage and birth defects, eye irritation, and blood and neurological disorders.

### THE THREAT RADIUS

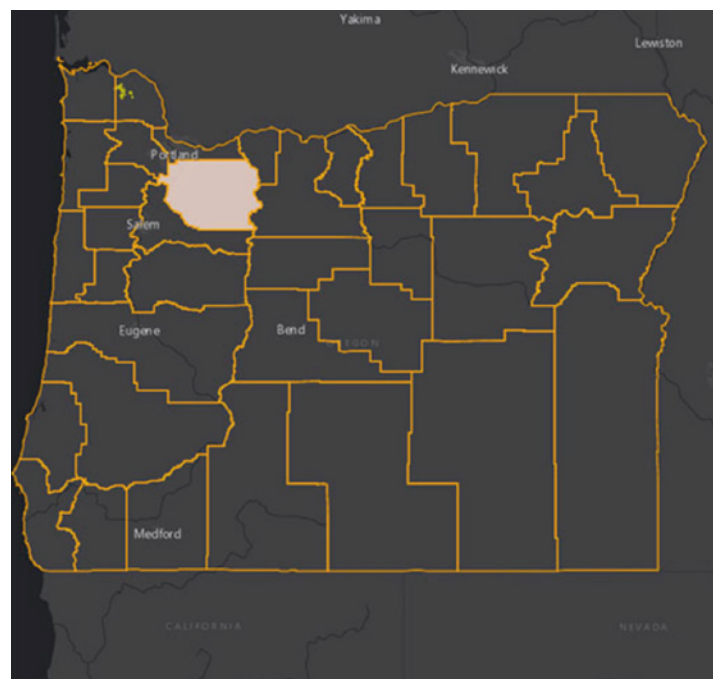

Peer-reviewed studies have documented higher levels of harmful air pollutants in and around areas with oil and gas production activity, and have shown that oil and gas facilities are the source of the excess pollution. Research indicates links between risks and/or prevalence of disease and proximity to facilities.<sup>3</sup> The half mile “threat radius” is a very conservative estimate of the area within which higher levels of toxic pollution are seen, and the distance within which health impacts have most clearly been correlated with the presence of oil and gas facilities.<sup>4</sup>

There are currently 12.4 million people living within a half mile of one of 1,193,118 active oil and gas wells, compressors, and processors in the United States. In total, 184,578 square miles are covered by the threat radius<sup>5</sup>, which includes 11,543 schools and 639 medical facilities. Nationwide, 238 counties in 21 states face a

cancer risk that exceeds EPA’s one-in-a-million threshold level of concern.<sup>6</sup>

### OIL & GAS THREATENS OREGON

**More than one hundred of Oregon’s residents live within a half mile threat radius of one of the state’s 56 methane-**

emitting oil and gas facilities. Encompassed in the 20 square miles covered by the threat radius is one school, putting some of Oregon's most vulnerable at risk.

## THE NUMBERS<sup>7</sup>

<b>TOTAL POPULATION</b> Living in the Threat Radius (within a half mile of a facility)	101
<b>TOTAL NUMBER</b> of Active Oil and Gas Wells, Compressors, and Processors	56
<b>NUMBER OF COUNTIES</b> that Exceed EPA's Cancer Risk Level of Concern	0
<b>NUMBER OF SCHOOLS</b> in the Threat Radius	1
<b>NUMBER OF MEDICAL FACILITIES</b> in the Threat Radius	0
<b>SQUARE MILES COVERED</b> by the Threat Radius	20

## STRONG FEDERAL STANDARDS ARE KEY

On May 12, 2016, the Environmental Protection Agency (EPA) finalized the first-ever federal standards addressing new and modified sources of methane pollution from the oil and gas sector. These standards require, among other things, that companies regularly monitor for and repair leaks.<sup>8</sup> The EPA expects this rule to cut 510,000 tons of methane pollution from oil and gas facilities and equipment, the emissions equivalent of 11 coal-fired power

plants or taking 8.5 million cars off the road every year.<sup>9</sup> These standards will also significantly impact public health by curbing emissions of smog-forming volatile organic compounds (VOCs) and toxic air pollutants.

The 2016 standards were an important first step, but in 2018, nearly 90% of methane emissions will come from existing sources not covered by this rule.<sup>10</sup> Strong methane standards for both new *and existing* sources are key to the Administration's ability to meet its Paris climate commitments to reduce greenhouse gas emissions 26-28% below 2005 levels by 2025.<sup>11</sup> Therefore, the EPA must develop strong and effective standards for existing sources as soon as possible, both to meet its legal commitments and to protect public health and welfare. **Without strong standards on existing sources, millions of people — including the more than one hundred in Oregon within the threat radius — will continue to be at risk.**

## COMMON-SENSE SOLUTIONS ARE READILY AVAILABLE

Thankfully, common-sense solutions exist not only to clean-up and fix methane leaks, but to boost local economies as well. More than 500 locations in 46 states are already manufacturing the equipment and providing the services needed to reduce methane pollution, **including one company headquarters, sales location, and service facility in Oregon.** These businesses are helping to grow the local economy by creating highly skilled, good-paying jobs.<sup>12</sup>
